CERTIFIED REFERENCE MATERIAL
FOR MERCURY INTRUSION

BAM-P126
Material: Flat Membrane

Certified properties:

Pressure-volume curve between 0,55 MPa and 2,1 MPa of mercury intrusion

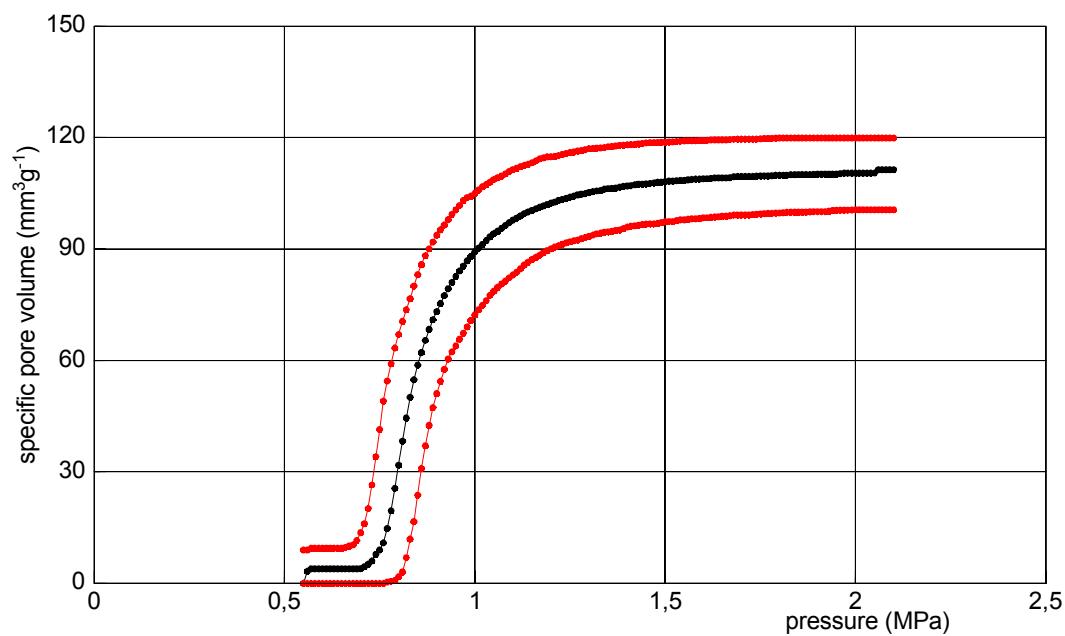

Figure 1 Reference curve (black) with simultaneous prediction band at the significance level 0,95 (red)
for the material BAM-P126
(for discrete values see annex)

certified

Certified discrete values of BAM-P126 (curve characteristics)

Quantity	Certified values	0,95-Confidence Interval	Unit
y_1 $V_{p, 2,1 \text{ MPa}}$ (specific pore volume at 2,1 MPa)	110,9	110,2 - 111,6	$\text{mm}^3 \text{g}^{-1}$
y_2	0,8682	0,8648 - 0,8717	MPa
y_3	0,2965	0,2939 - 0,2991	MPa
p_{50}	0,8441	0,8406 - 0,8475	MPa
d_{50}	1,746	1,739 - 1,753	μm

Quantity	Certified values	0,95-Prediction Interval	Unit
y_1 $V_{p, 2,1 \text{ MPa}}$ (specific pore volume at 2,1 MPa)	110,9	102,4 - 119,4	$\text{mm}^3 \text{g}^{-1}$
y_2	0,8682	0,8274 - 0,9091	MPa
y_3	0,2965	0,2660 - 0,3271	MPa
p_{50}	0,8441	0,8025 - 0,8856	MPa
d_{50}	1,746	1,661 - 1,832	μm

The confidence intervals and the prediction intervals result from the variance analytical investigation of the p-v curve characteristics y_1 (intruded volume at the saturation point), y_2 (the $p_{57,5}$ -value) and y_3 (see below and Figure 2). The determination of the curve characteristics are described in the certification report in detail.

y_1 : intruded volume at the saturation point 2,1 MPa (saturation value)

y_2 : pressure at 57,5 % of the saturation value

This value has been determined by local polynomial estimation (Epanechnikov kernel with band width $h = 0,05 \text{ MPa}$)

y_3 : difference of the pressures at which the smoothed curve has got 87,5 % resp. 25 % of the saturation value (see Figure 2)

The transformation of the intrusion pressure data p_{Hg} into pore diameter values d_p according to the Washburn equation $d_p = - 4 \gamma \cos\theta / p_{Hg}$ (assuming a cylindric pore model) has to be carried out using the following values of the parameters: $\gamma = 0,48 \text{ N m}^{-1}$ (surface tension of mercury) and $\theta = 140^\circ$ (contact angle of the mercury) according to DIN 66133.

The prediction interval is relevant for the user, especially for the specific pore volume y_1 resp. the pressure p_{50} and the diameter d_{50} .

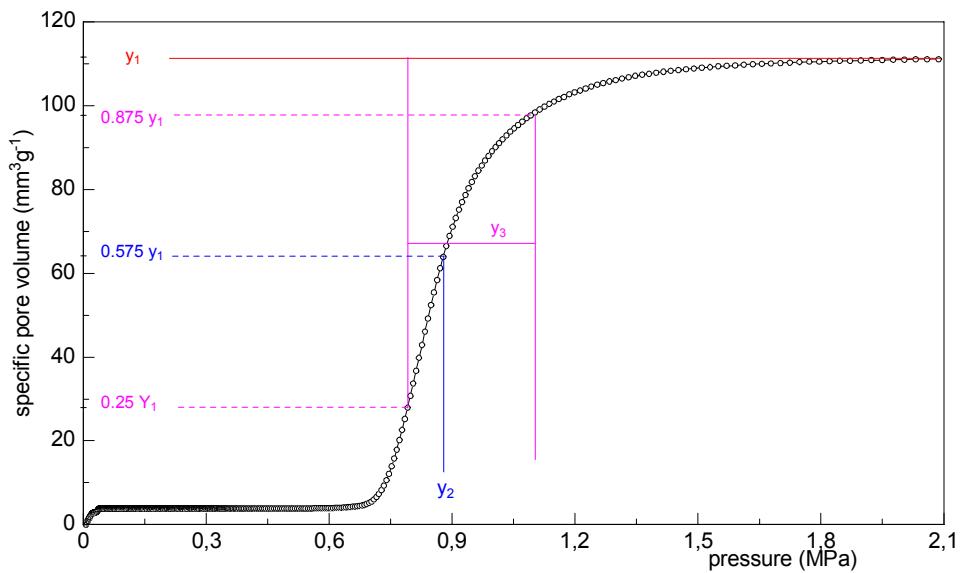

Figure 2 Standardization of the pressure-volume curves (see certification report)

Non-certified properties*:

Quantity	Unit	Value
Specific surface area	$\text{m}^2 \text{g}^{-1}$	0,3
Bulk density	g cm^{-3}	2,6
Apparent density	g cm^{-3}	3,8
Porosity	%	30

* only as additional information, given without uncertainty

DESCRIPTION OF THE SAMPLE

The reference material consists of flat membranes of α -alumina; the producer is the Institut für Technische Keramik, e.V. (HITK), Hermsdorf, Germany. The whole batch of the material has been divided into 50 plates. The plates were sintered. Each plate has been cut into 30 pieces, numbered by means of a laser beam. In contrast to dispersed materials, there is no possibility of homogenizing the whole candidate material as in the case of the compact samples. The homogeneity of the batch was tested inside the experimental design of the whole round robin.

INSTRUCTION FOR USE

The reference material is intended for use in the calibration and especially for the checking of the low-pressure range of mercury porosimeters in the range between 0,55 and 2,1 MPa.

The closed bottle should be stored at ambient temperature in a dry place.

The required sample intake is 1 piece flat membrane per experiment.

Use mercury with a purity of 99,99 % (out gassed) or better.

Prior to the analysis, a heating procedure for drying the sample is not necessary, if the sample is handled as described.

DATA EVALUATION

- Measure 1 piece of the membranes and put your measured pressure-volume curve into the diagram with the reference curve and the prediction band, see Figure 1.
- If the volume and pressure sensors of the porosimeter had been correctly calibrated the measured curve lies, with the selected probability, completely between the curves defining the bounds of the prediction band of level (1- α).
- Definition of the prediction band:
A prediction band of level (1- α) covers the measured curve over the given pressure interval (0,55–2,1 MPa) completely with the selected probability. The size of prediction bands depends on the number of measured points per curve. Bands given here are for about 60 measured points per curve.

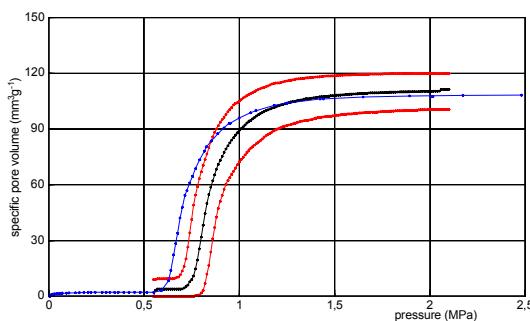

Figure 3 Demonstration of the calibration error in the pressure sensor of the device
reference curve - black
prediction band with 0,95 significance level - red
test curve - blue

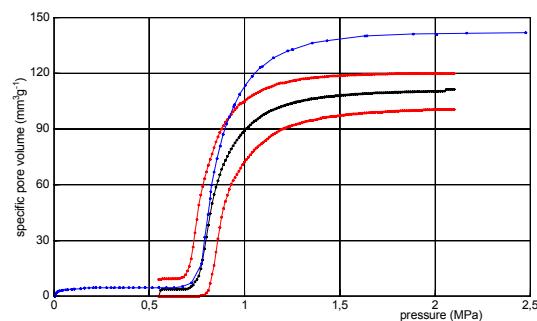

Figure 4 Demonstration of the calibration error of the volume of the device
reference curve - black
prediction band with 0,95 significance level - red
test curve - blue

SHELF LIFE

Provided the sample is stored and handled appropriately, the certification will remain valid for 24 months from the date of shipment.

PARTICIPATING LABORATORIES

Co-ordination

Bundesanstalt für Materialforschung und -prüfung, DE

Participants:

- Bundesanstalt für Materialforschung und -prüfung (BAM), (5 equipments in 2 laboratories), Berlin, DE
- Degussa AG, Hanau, DE
- DMT - Gesellschaft für Lehre und Bildung mbH, Bochum, DE
- Eidgenössische Materialprüfungs-und Forschungsanstalt (EMPA), CH
- Forschungsinstitut für anorganische Werkstoffe - Glas/Keramik - GmbH, Höhr-Grenzhausen, DE
- Fraunhofer-Institut für Bauphysik, Valley-Oberlandern, DE
- Hermsdorfer Institut für Technische Keramik e.V., Hermsdorf/Thür., DE
- Micromeritics GmbH, Mönchengladbach, DE
- Quantachrome GmbH, Odelzhausen, DE
- Technische Universität Dresden, Dresden, DE
- Technische Universität Hamburg-Harburg, Hamburg, DE

- ThermoQuest Italia S.p.A., CE Instruments, Rodano (Milan), IT
- Universität Hannover, Hannover, DE

ANALYTICAL METHODS USED

Mercury intrusion according to DIN 66133

DOCUMENTATION

Guidelines for the production and certification of BAM reference materials

BCR/48/93 (1994) Guidelines for the production and certification of BCR reference materials

ASTM D 4284-92 Standard test method for determining pore volume distribution of catalysts by mercury intrusion porosimetry

BS 7591-1 : 1992 Porosity and pore size distribution of materials.
Method of evaluation by mercury porosimetry

DIN 66133 : 1993 Bestimmung der Porenvolumenverteilung und der spezifischen Oberfläche von Feststoffen durch Quecksilberintrusion
(Determination of the pore volume distribution and the specific surface area of solids by mercury intrusion)

Note:

BAM-Project "Porous Reference Materials": P. Klobes

The overall co-ordination leading to this certificate and the issuance of the material was performed by B. Röhl-Kuhn.

Statistics: Jörg Polzehl, Weierstraß-Institut Berlin

LEGAL NOTICE

Neither the Federal Institute for Materials Research and Testing (BAM) nor any person acting on its behalf make any warranty or representation, expressed or implied, that the use of any information, material, apparatus, method or process disclosed in this document may not infringe privately owned rights, or assume any liability with respect to the use of, or damages resulting from the use of any information, material, apparatus, method or process disclosed in this document.

This certificate is valid 10 years after seal affixation; this validity may be extended as further evidence of stability becomes available.

Date of certification: 2005-02-11
Date of shipment:
