# Certificate of Analysis

Standard Reference Material<sup>®</sup> 1634c

## Trace Elements in Fuel Oil

This Standard Reference Material (SRM) is intended for use in the evaluation of methods and the calibration of apparatus used for the determination of trace elements in fuel oils and other materials of a similar matrix. Each SRM unit consists of 100 mL of the fuel oil.

The certified values for SRM 1634c were established using the equally weighted means of the results of two independent analytical methods. The values and their uncertainties are listed in Table 1. Noncertified values are given in Table 2 and are provided for information only. All values are reported as mass fractions [1].

SRM 1634c is a commercial "No. 6" residual fuel oil as defined by the American Society for Testing and Materials (ASTM) based on a kinematic viscosity value of 0.000301 m<sup>2</sup>/s at 40 °C. The flash point of SRM 1634c is 43 °C. Viscosity and flash point values, which are based on analysis provided by a commercial laboratory using ASTM methods, are provided only as information to better characterize the SRM matrix.

### NOTICE AND WARNINGS TO USERS

**Expiration of Certification:** The certification of this SRM lot is valid within the specified measurement uncertainties until **31 December 2012**, provided the SRM is handled and stored in accordance with the instructions given in this certificate. However, the certification will be nullified if the SRM is contaminated or otherwise modified.

**Maintenance of SRM Certification:** NIST will monitor this SRM over the period of its certification. If substantive technical changes occur that affect the certification before the expiration of this certificate, NIST will notify the purchaser. Return of the attached registration card will facilitate notification.

**Precautions:** When the material is not in use, it should be stored in the tightly sealed bottle.

The overall direction and coordination of the analytical measurements leading to certification were performed by R.L. Watters, Jr., of the NIST Analytical Chemistry Division.

Additional analyses in support of this certification were performed by J. Sieber of Texaco, Inc., Beacon, NY, and by U. Reus, H. Buddeker, and A. Prange of GKSS Research Center, Geesthacht, Germany.

Statistical analysis was performed by S.B. Schiller of the NIST Statistical Engineering Division.

The technical and support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the NIST Standard Reference Materials Program by J.S. Kane (retired) and B.S. MacDonald.

Certificate Issue Date: 08 February 2002  
*See Certificate Revision History on Last Page*

The homogeneity studies by X-ray fluorescence were performed by P.A. Pella and A.F. Marlow and certification analyses for the various elements were performed by D.A. Becker, R. Demiralp, J.D. Fassett, R.R. Greenberg, W.R. Kelly, K.E. Murphy, P.J. Paulsen, M.S. Rearick, R. Saraswati, G.C. Turk, L.J. Wood, and L. Yu of the NIST Analytical Chemistry Division.

**Recommended Use:** Because of the viscosity of “No. 6” residual fuel oil, the SRM unit must first be warmed to 40 °C on a water bath and then shaken vigorously, or stirred with a clean stirrer before sampling. Also, the oil contains particulate matter that causes it to be distinctly heterogeneous. Certification of SRM 1634c is based on a well-mixed sample size of 1 g as determined by studies performed by X-ray fluorescence, as well as on data from certification analyses. Therefore, a minimum sample size of 1 g should be used for analysis to assure that results are representative of data that can be expected to fall within the uncertainties of the certified values shown on this certificate.

Table 1. Certified Values

| Element  | Mass Fractions<br>(mg/kg) | Methods of Analysis |
|----------|---------------------------|---------------------|
| Arsenic  | 0.1426 ± 0.0064           | FIA-HAAS, INAA      |
| Cobalt   | 0.1510 ± 0.0051           | ICP-MS, INAA        |
| Nickel   | 17.54 ± 0.21              | ID-ICPMS, LEI       |
| Selenium | 0.1020 ± 0.0038           | FIA-HAAS, INAA      |
| Vanadium | 28.19 ± 0.40              | ICP-AES, INAA       |

The expanded uncertainties of the certified values are at a level of confidence of approximately 95 % and include within-method sources of uncertainty, which were either statistically evaluated (Type A) or evaluated by other means (Type B) [2]. For arsenic, an allowance for the difference between the methods is also included.

#### SUPPLEMENTAL INFORMATION

The analytical values reported in Table 2 are not certified because of material heterogeneity. These values are provided for information only.

Table 2. Noncertified Values

| Element  | Mass Fraction<br>(mg/kg) (%) | Method of Analysis |
|----------|------------------------------|--------------------|
| Barium   | 1.8                          | INAA               |
| Chlorine | 45                           | INAA               |
| Sodium   | 37                           | INAA               |
| Sulfur   | 2                            | ID-TIMS            |

#### Methods:

|          |  |
|----------|--|
| FIA-HAAS | Flow-injection hydride generation atomic absorption spectrometry |
| ICP-AES  | Inductively coupled plasma atomic emission spectrometry          |
| ICP-MS   | Inductively coupled plasma mass spectrometry                     |
| ID-ICPMS | Inductively coupled plasma dilution isotope mass spectrometry    |
| ID-TIMS  | Isotope dilution thermal ionization mass spectrometry            |
| INAA     | Instrumental neutron activation analysis                         |
| LEI      | Laser-enhanced ionization  |
