

N?-2-Azidoethyloxycarbonyl-L-lysine

Art. ID TRC-A848920-250MG
Unit 250 mg
Deliverydetails De Minimis

Description

Application Note: N?-2-Azidoethyloxycarbonyl-L-lysine is derived from 2-Azidoethanol (A848560), which is used as a reagent in the glycosylation of mono- or polysaccharides. 2-Azidoethanol is also used as a 2'-deoxy-ethynyluridine (EdU) blocker in nuclear DNA, preventing cross reactivity with other antibodies in order to better study its related pathways in the body.
